

Peer Review of Michael Zheng

Joshua Rabara

December 2022

In Michael's paper, he talks about the effects of customer reviews in correlation to how they cause items online to sell better, therefore fake reviews must be accounted for. Leading Michael to generate code that is able to detect fake reviews on products in Amazon's system. From a mathematical and logical standpoint, this paper feels quite solid. Michael knows what he's talking about and is able to back this up with not only proper mathematical representation, but explanations to many details. My only main concern at the moment is the amount of pages he lacks. Besides that, I don't find any problems with the paper. The only problem that should be improved is the repetitiveness and more to add. I don't find many other problems besides that and he needs done is to add more content.
